

Advanced Psychological Statistics II

PSYX 521

Spring 2021

Meeting Times: Fridays, 12:30 – 3:20pm

Location: **REMOTE**

Instructor: Daniel J. Denis, Ph.D.
Office: 369 Skaggs Building
E-mail: daniel.denis@umontana.edu
Spring Office Hours: M, 12-1; W, 12-2. (Zoom)

Course Overview

This course is a continuation of Psyx. 520 (Stat I). The goal is to learn and understand statistics, so that you can think about them **creatively** and **critically** when doing your own research, as well as when interpreting research in your field. The goal is for you to **understand** essential principles common to virtually all statistical techniques, understand to some extent what's going on "under the hood," so that you eventually can "own" the knowledge and have the concepts "down" to further your learning over the course of your career. The number of statistical and quantitative techniques in applied science is enormous, but many (at least in univariate and bivariate settings) are in one way or another related to principles of ANOVA, regression, and spin-offs of those techniques. So-called "advanced statistics" are built on fundamental core principles. If those fundamental principles are not understood, then tackling (and understanding) relatively complex techniques (such as might be later featured in a multivariate course, namely multivariate analysis of variance, discriminant analysis, principal components analysis, factor analysis, structural equation modeling, etc.) becomes very difficult to impossible. This course aims to give you a solid foundation, one you will have for the remainder of your careers, and will pay dividends as you learn new techniques and both conduct and digest novel research.

The course is designed for graduate students in psychology. Issues in measurement will also arise over the course, for example, in seminars. Performing statistical analyses on a measurement of one's anxiety is only as good as how well the given measure "taps" into the construct of anxiety. Similarly, issues of measurement also rear their head when contemplating how to best parameterize the statistical model of linear regression, which sometimes requires the use of special coding schemes to accommodate various types of data.

Course Objectives

By the end of the course, you should have a reasonable understanding of the following topics (not necessarily covered in this order):

- A more solid understanding of the principles of Psyx. 520
- Random Effects Models
- Mixed Models, including Repeated Measures and Longitudinal Designs
- Randomized Block Designs
- A more broad understanding of Experimental Method (and alternatives)
- Simple Linear Regression, Correlation, and Bivariate Distributions
- Multiple Regression and the Nature of Multivariate Distributions
- Model Building with ANOVA or Regression

- Analysis of Covariance, Logistic Regression
- Generalized Linear Models (Introduction)

You will also be exposed to some or all of the following:

1. Bayesian Statistical Analysis (as an alternative to NHST)
2. Classical Measurement Theory in Test Construction.
3. Bootstrapping and Resampling Techniques.
4. Log-linear Analysis.
5. Data Management Using SPSS.
6. Missing Data in Statistical Analyses.
7. Putting Statistics into Context: The Role of Statistics in Science.
8. Mediation Analysis.
9. Path Analysis and Structural Equation Models
10. Non-parametric Statistical Methods

Credits: 4.0

Course Materials

Required: Howell, D. C. (2010). *Statistical Methods for Psychology*. Duxbury.

Optional: Montgomery, D. C. (2005). *Design and Analysis of Experiments*. Wiley.

Other Optional Texts

Hays, W. L. (1994). *Statistics*, 5th ed. Wadsworth Publishing Company, Belmont CA.

Kirk, Roger E. (2007). *Statistics: An Introduction*. 5th ed. Thomson/Wadsworth.

Software Texts (Optional)

Morgan, G. A. (2012). *IBM SPSS for Intro Stats*. Routledge. 5th edition.

Leech, N. L. (2014). *IBM SPSS for Intermediate Stats*. Routledge. 5th edition.

Teetor, P. (2011). *R Cookbook*. O'Reilly.

VanderPlas, J. (2017). *Python Data Science Handbook*. O'Reilly.

Office Hours

Office hours are held weekly. You are also strongly encouraged to e-mail questions to the instructor and/or TA, as they arise. Writing your question out in an e-mail, as clearly as you can, is an excellent way to clarify what you do not understand, and often, you achieve a deeper understanding of the topic itself while writing out your e-mail. **Please be as detailed and specific as you can in your e-mail**, so we know how to frame our response to best suit your needs.

Final Grade Assignment

There are 4 components that will make up your final grade*:

1. Midterm Test (10%)
2. Assignments (20%)
3. Seminar (20%)
4. *Final Exam (50%)

* If your final exam grade is better than your mid-term test grade, your final exam will be worth 60% instead of 50%. The final exam is cumulative over the entire course (including material already covered on the midterm). Assignments and evaluations will consist of multiple choice and short-answer.

Student Seminars

The student seminar component of the course comprises 20% of your final grade, and is an important component of this course. **The primary criteria is that your seminar be a very strong presentation of a statistical topic.** It is expected that you will begin preparing for the seminar now, so that by the time you present, it represents something extremely well-prepared and advanced (in-depth, shallow, surface content will receive no points).

Seminars can be done on topics such as the following:

1. Bayesian Statistical Analysis (as an alternative to NHST)
2. Classical Measurement Theory in Test Construction.
3. Bootstrapping and Resampling Techniques.
4. Log-linear Analysis.
5. Data Management Using SPSS.
6. Missing Data in Statistical Analyses.
7. Putting Statistics into Context: The Role of Statistics in Science.
8. Mediation Analysis.
9. Path Analysis and Structural Equation Models.
10. Non-parametric Statistical Methods.

Accommodation of Students with Disabilities

In accordance with the University of Montana’s mission to provide equal educational opportunities for all students, the instructor is willing to provide necessary accommodations for students with disabilities. If you require any accommodations, please make these known to the instructor, who will work with the office of Disability Services in adapting this course to meet your needs.

Attendance

Past experience in this course suggests that students who miss classes, usually receive poor grades. This is a reflection of the difficulty of the subject, and the need to stay on pace with the class and course. Attending class lectures usually helps a great deal in understanding material.

Incompletes

Departmental and university policies regarding incompletes do not allow one to change “incomplete” grades after 1 year has passed since the “I” was granted.

Mathematical Arguments Used in Statistics

As was true of Stat I, Stat II will **not** be taught as if it were a mathematics course because **statistics is not equal to mathematics**. You will not be tested on whether you can prove or justify the equations that make up the discipline of statistics. Most test items, as was true of Stat I, will focus on your **understanding and grasp of the material**, both through applied questions and theoretical or conceptual questions. However, familiarity with the mathematics of statistics can sometimes (but not always) aid in your understanding of the fundamental concepts. For that reason, lectures, as well as handouts, will sometimes contain mathematical arguments to help in your understanding of statistics. However, as was the case in Stat I, knowing how to “work” a formula or follow a mathematical argument **may or may not** help you in understanding the underlying statistical concept. If you understand the concept however, the math often (but not always) makes much more sense, and may help to fill “gaps” in your conceptual knowledge. As well, learning the math might help you in understanding statistical concepts. It’s generally a two-way street, but guard against knowing the math, without understanding the underlying conceptual meanings. Tests and exams will aim to evaluate your **understanding** of statistics – the do you “get it” part. In this course, mathematics is simply seen as a way of expressing this understanding. Do not memorize anything, but instead, seek to understand.

A Note on the Use of Statistical Software

SPSS and R will be used in this course and featured in assignments. Although SPSS and R will be featured, it is of **extreme importance** that you do not equate “SPSS and R knowledge” with statistical knowledge. The emphasis in this course will be on first understanding statistics, then applying them on the computer. Learning how to use SPSS and R effectively and efficiently is relatively easy **IF YOU FIRST UNDERSTAND THE STATISTICAL PROCEDURES** which they offer. It is much easier to know what a multiple regression is first, then learn how to do it on a computer, than to know how to do it on a computer, and be totally clueless as to what it is. **Further, you will rarely be asked at a thesis or dissertation defense to demonstrate your knowledge of SPSS or R, no more than you would be asked to demonstrate your ability to use your pocket calculator. However, you will likely be asked to defend the statistics you’ve used in your research, and what they mean.**

“TENTATIVE” COURSE SCHEDULE

DATE	TOPIC	READINGS ASSIGNED	ASSIGNMENTS
15 Jan.	Course Syllabus, Course Policies, Preview of Course Where We Are Going	Anaesthetic article Zoom lecture article	
22 Jan.	Review and Deepening of Stat I Principles Applying Your Knowledge in Critically Evaluating Research Findings		Zoom Meeting 12:30- TBD. Discussion/Review of Stat I Principles #1 (assigned)
29 Jan.	Factorial ANOVA – Recap and Extensions	13	Optional R Zoom Lab 12:30-2:00 (Linus)
05 Feb.	Randomized Blocks/Repeated-Measures Designs I	Research paper (TBA)	#1 Due - Submission and Zoom Discussion @ 12:30 - 1:30.
12 Feb.	Repeated-Measures Designs II	14	#2 (assigned)
19 Feb.	Repeated-Measures Designs III	14	
26 Feb.	Correlation and Regression - Recap and Extensions	9/10	#2 Due - Submission and Zoom Discussion @ 12:30 - TBD.
05 Mar.	Multiple Regression I	15	#3 (assigned)
12 Mar.	Multiple Regression II / Midterm 10% (Take Home)	15	
19 Mar.	Multiple Regression III / Logistic Regression	15	#3 Due - Submission and Zoom Discussion @ 12:30 - 1:30.
26 Mar.	Interpreting Multiple Regression Models in Science	15	#4 (assigned)
02 Apr.	STUDENT BREAK (NO CLASS)		
09 Apr.	Analysis of Covariance	16	#4 Due - Submission and Zoom Discussion @ 12:30-1:30PM
16 Apr.	Zoom Seminar Presentations		ZOOM: 12:30-3:20
23 Apr.	Zoom Seminar Presentations		ZOOM: 12:30-3:20
29 Apr. 10:10 - 12:10	Final Exam	All Course Materials
